Broken Pages

The Broken Pages tab displays pages that are broken typically because of deleted, renamed, or moved pages in the system. A page gains dependency when it uses an external source for content, such as using an Asset or linking to another page. It then "depends" on the external content to exist. Therefore an issue is created when the directory, page, or Asset is deleted. This is why it is preferred to utilize the Dependency Manager rather than typing the path to another page in OU Campus. The Dependency Manager will update the links automatically, should a directory or page be renamed or moved. But any directory, page, or Asset that is deleted will still need to be repaired manually and can be found in this tab for correcting.

By previewing a page listed in the Broken Pages, the broken issues can be identified by hovering the mouse over a link and checking the Status bar for "*** Broken"…to identify the issue.
