

## **CHAPTER 7 SPATIAL DATA EDITING**

### 7.1 Location Errors

#### 7.1.1 Location Errors Using Secondary Data Sources

#### 7.1.2 Causes for Digitizing Errors

#### 7.1.3 Location Errors Using Primary Data Sources

### 7.2 Spatial Data Accuracy Standards

*Box 7.1 National Standard for Spatial Data Accuracy (NSSDA) Statistic*

### 7.3 Topological Errors

#### 7.3.1 Topological Errors with Geometric Features

#### 7.3.2 Topological Errors Between Layers

### 7.4 Topological Editing

*Box 7.2 GIS Packages for Topological Editing*

*Box 7.3 Topological Editing in ArcGIS*

#### 7.4.1 Topological Editing on Coverages

#### 7.4.2 Editing Using Map Topology

#### 7.4.3 Editing Using Topology Rules

### 7.5 Nontopological Editing

*Box 7.4 Basic Editing in ArcGIS*

#### 7.5.1 Editing Existing Features

#### 7.5.2 Creating Features from Existing Features

### 7.6 Other Editing Operations

*Box 7.5 Edgematching and Advanced Editing in ArcGIS*

#### 7.6.1 Edgematching

#### 7.6.2 Line Simplification and Smoothing

Key Concepts and Terms

Review Questions

### **Applications: Spatial Data Editing**

Task 1: Edit a Shapefile

Task 2: Use Cluster Tolerance to Fix Digitizing Errors Between Two Shapefiles

Task 3: Use Topology Rule to Fix Dangles

Task 4: Use Topology Rule to Ensure That Two Polygon Layers Cover Each Other

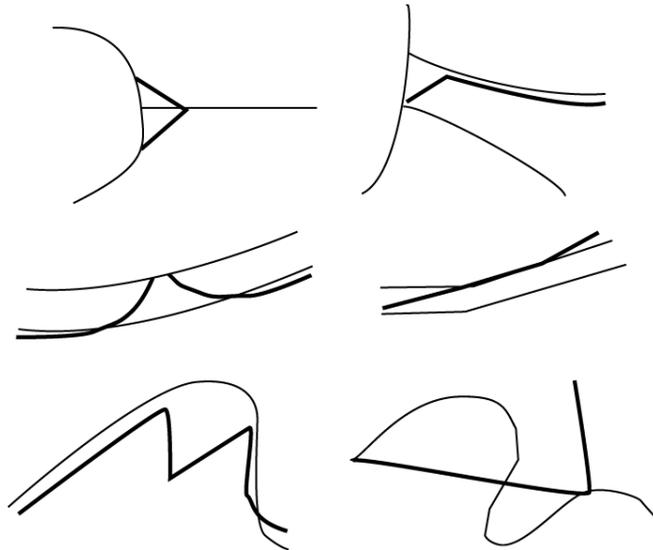

Task 5: Perform Edgematching

Challenge Question

References

# Location Errors

- Location errors refer to the geometric inaccuracies of digitized features.
- Location errors can be examined by referring to the data source for digitizing.

**Figure 7.1**  
Common types of digitizing errors from tracing. The thin lines are lines on the source map, and the thick lines are lines from tracing.

## Spatial Data Accuracy Standards

In the United States, the development of spatial data accuracy standards has gone through three phases:

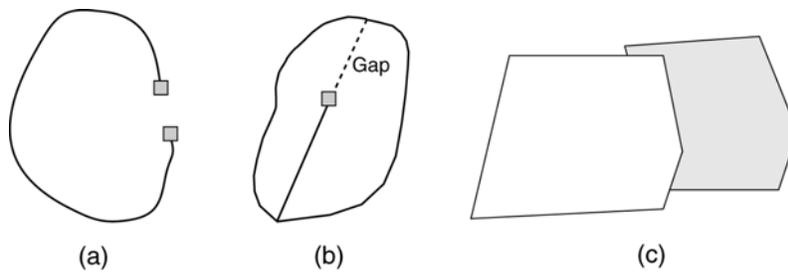

1. U.S. National Map Accuracy Standard, revised and adopted in 1947
2. Accuracy standards for large-scale maps proposed by the American Society for Photogrammetry and Remote Sensing in 1990
3. National Standard for Spatial Data Accuracy established by the Federal Geographic Data Committee in 1998

## Topological Errors

Topological errors violate the topological relationships either required by a GIS package or defined by the user.

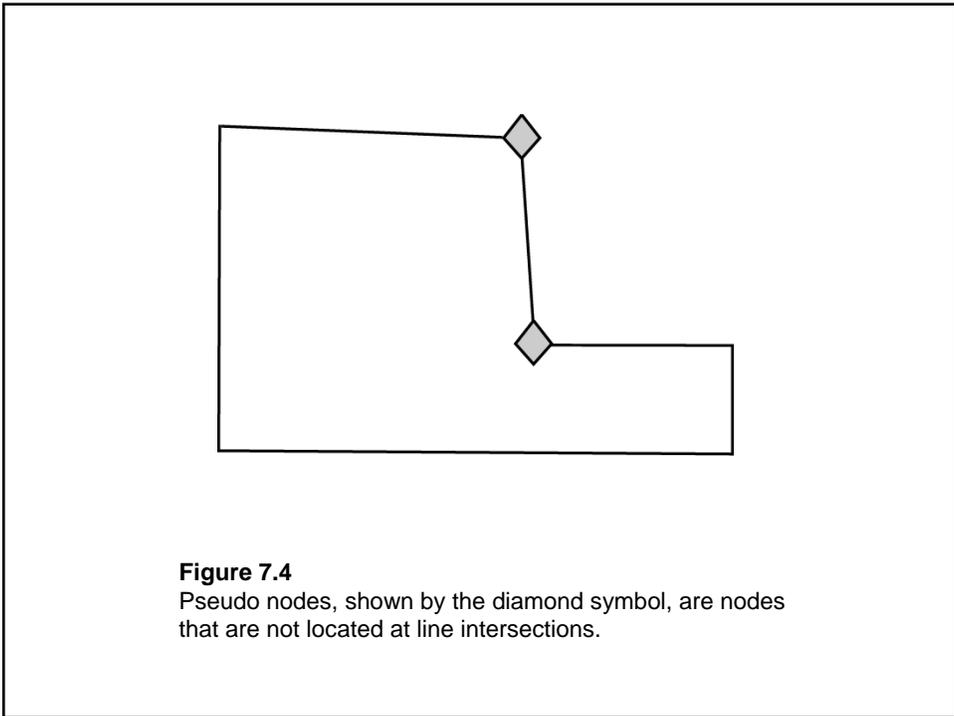

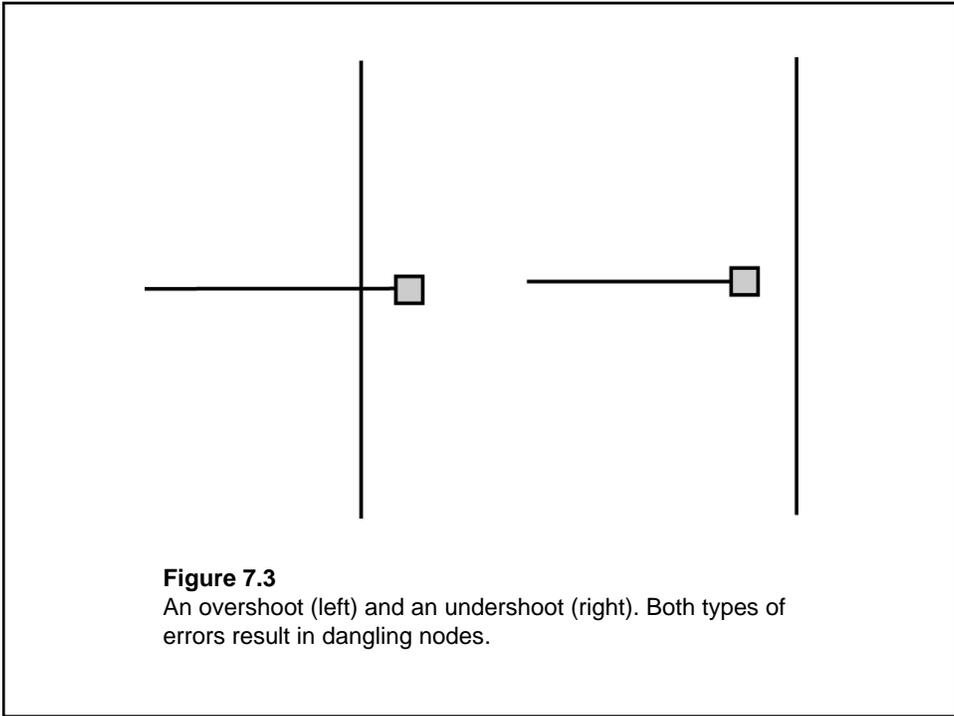

# Types of Topological Errors

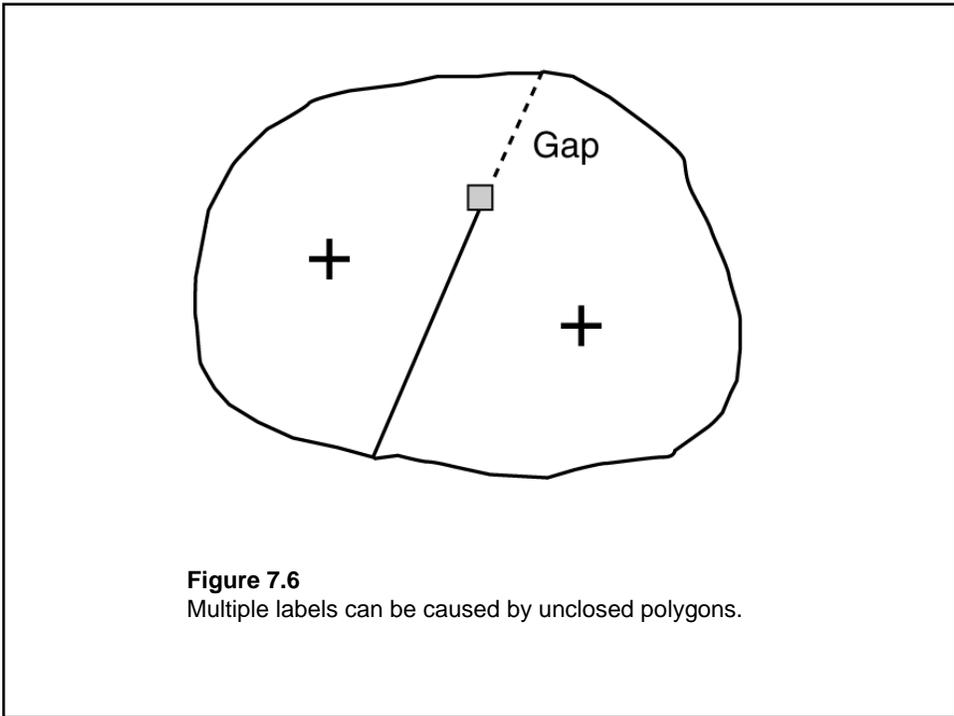

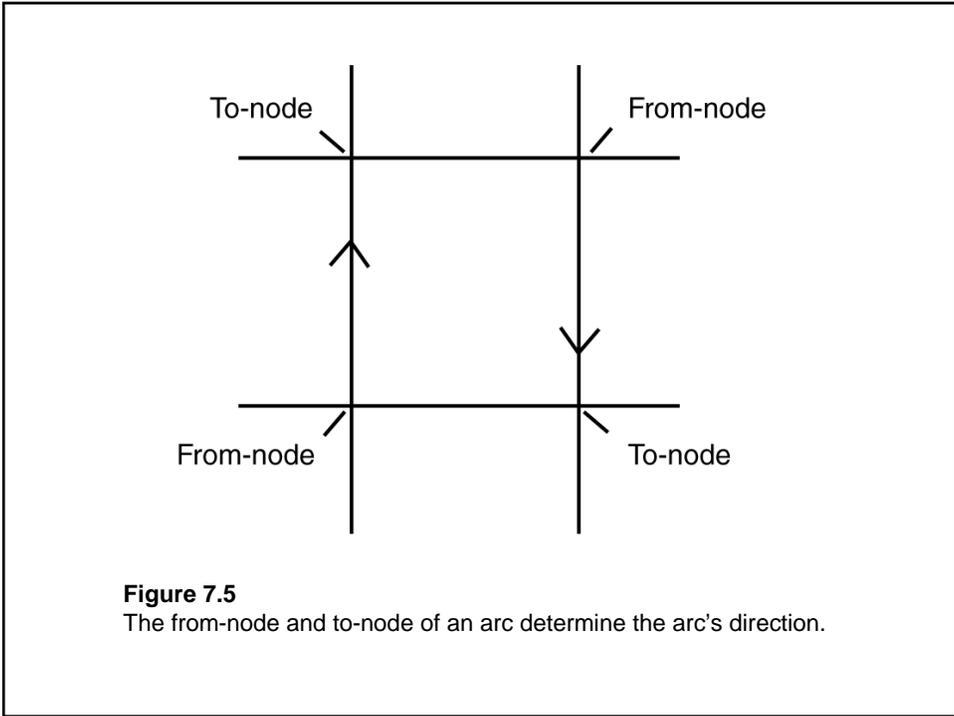

Topological errors with geometric features:  
undershoot, overshoot, dangling node, pseudo node,  
direction error, label error

**Figure 7.2**

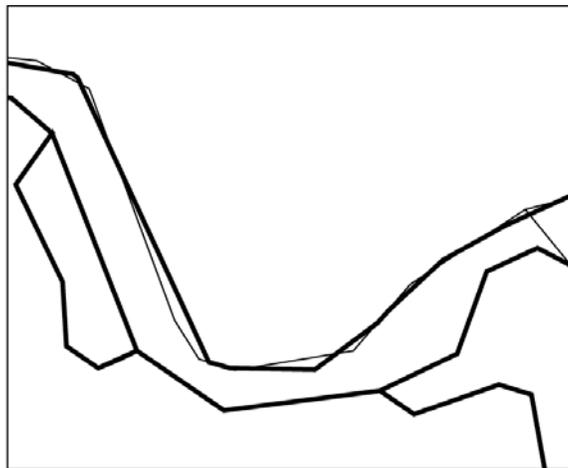

(a) An unclosed polygon, (b) a gap between two polygons,  
and (c) overlapped polygons.

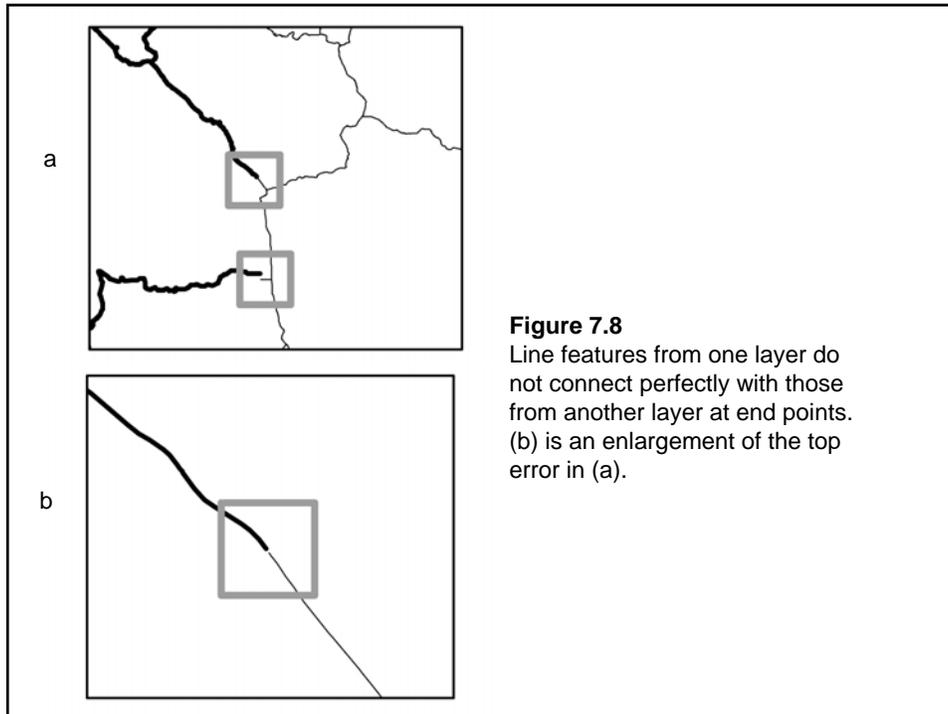

# Topological Errors

Topological errors between layers: boundaries not coincident, lines not connected at end points, overlapping line features, etc.

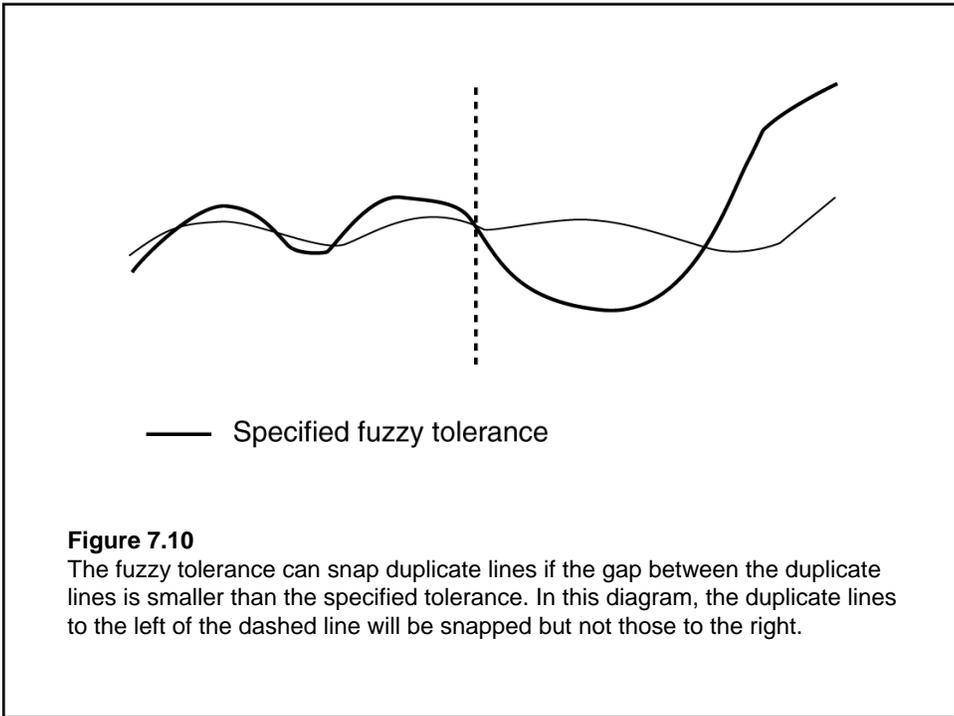

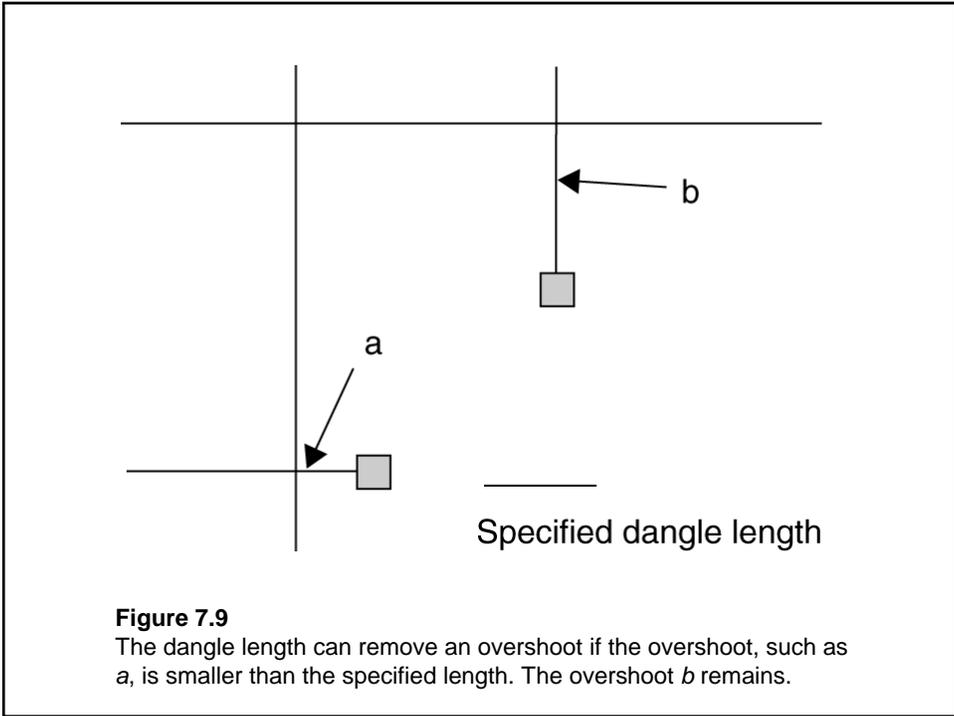

**Figure 7.7**  
The outline boundaries of two layers, one shown in a thicker line and the other a thinner line, are not coincident at the top.

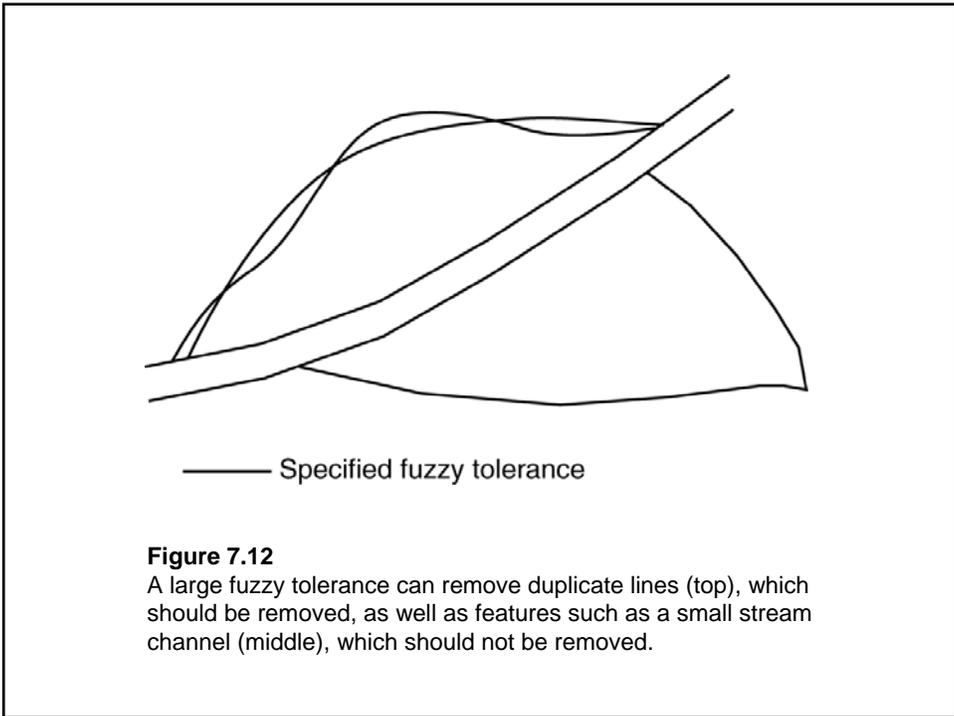

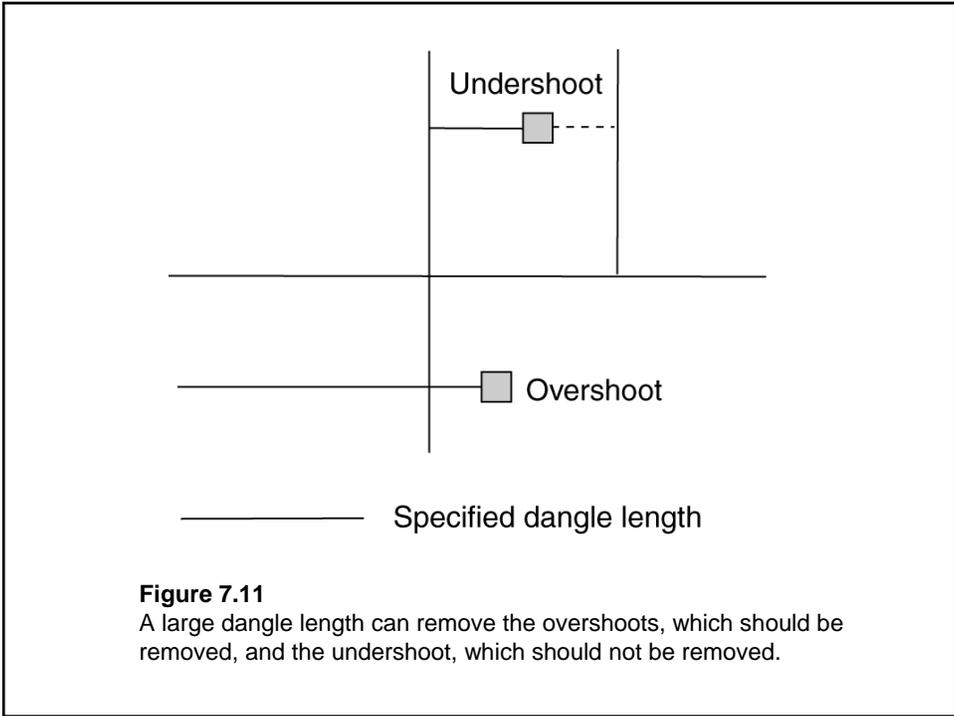

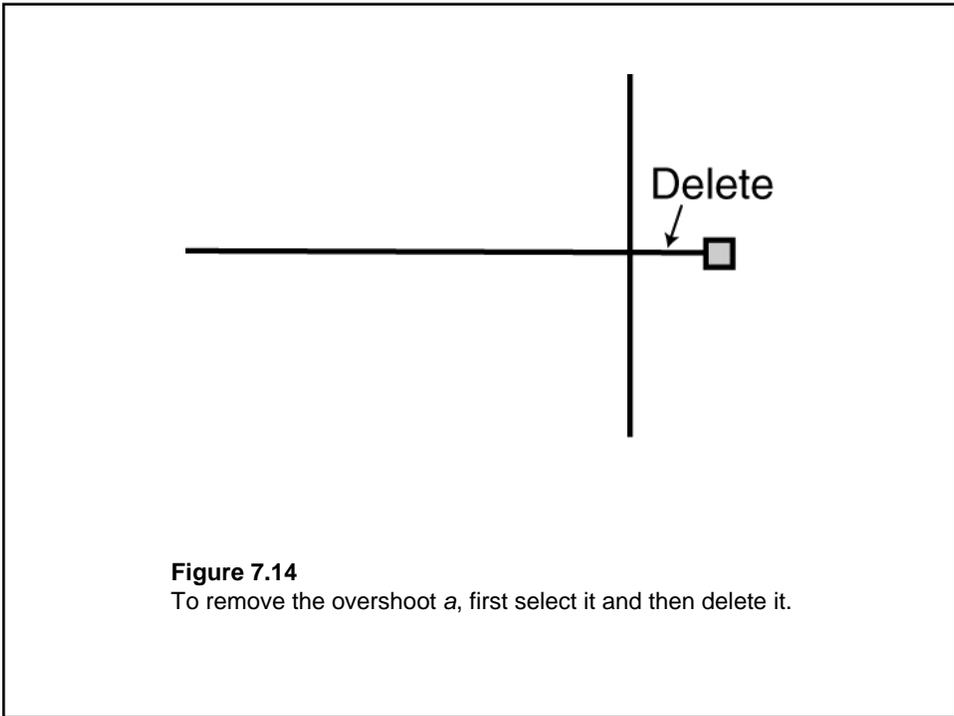

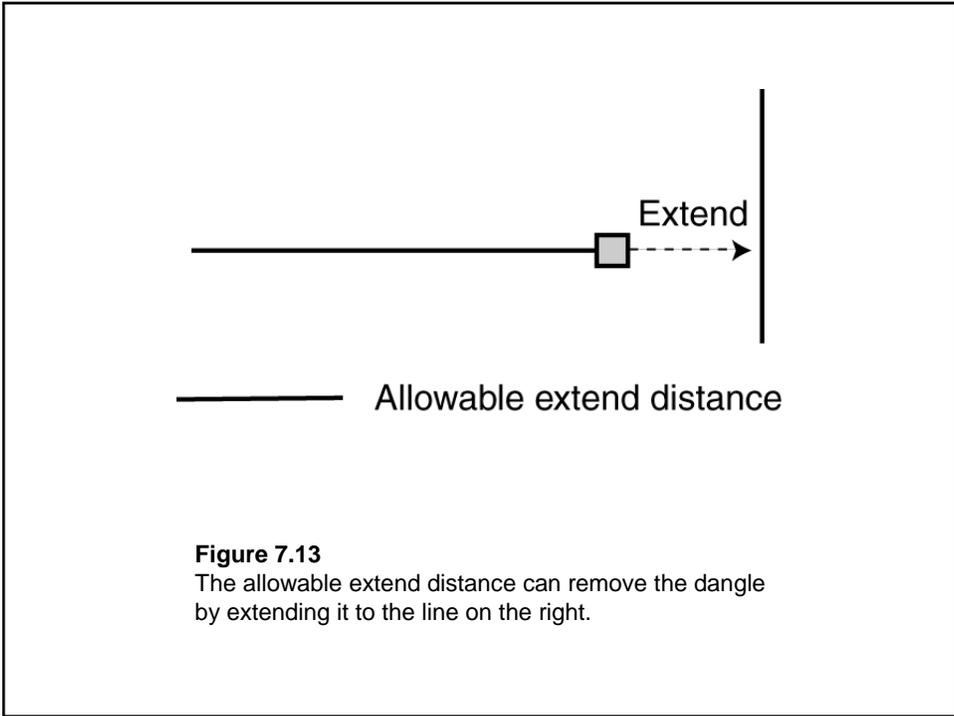

## Topological Editing

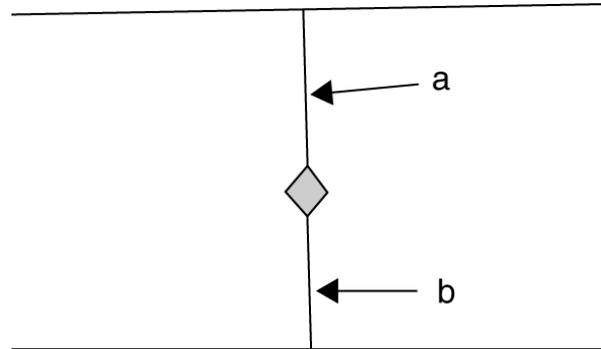

Topological editing ensures that digitized spatial features follow the topological relationships that are either built into a data model or specified by the user.

1. Topological Editing on Coverages
2. Editing Using Map Topology
3. Editing Using Topology Rules

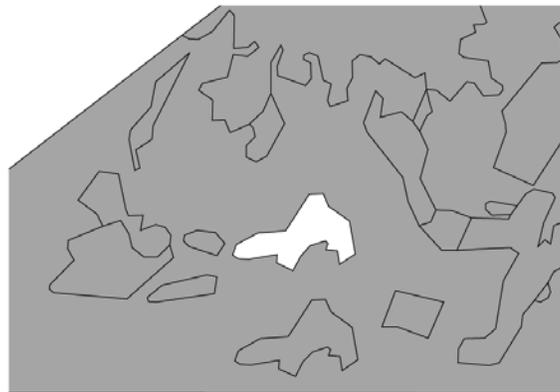

**Figure 7.15**

To remove the pseudo node, select *a* and *b*, assign the same ID value to both, and un-split them.

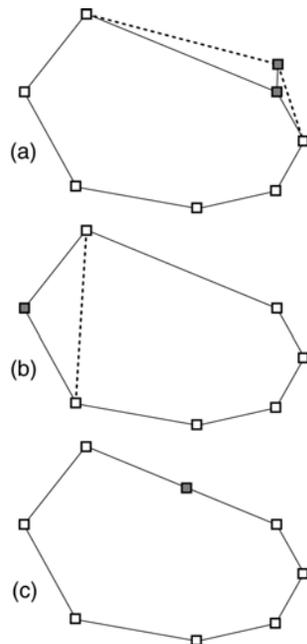

**Figure 7.16**

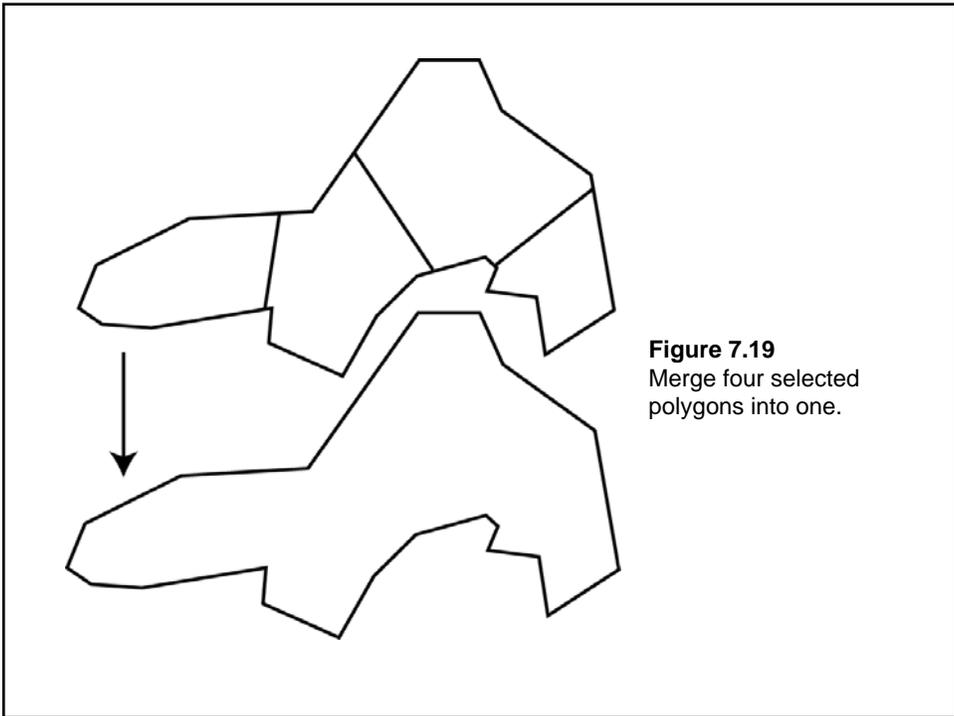

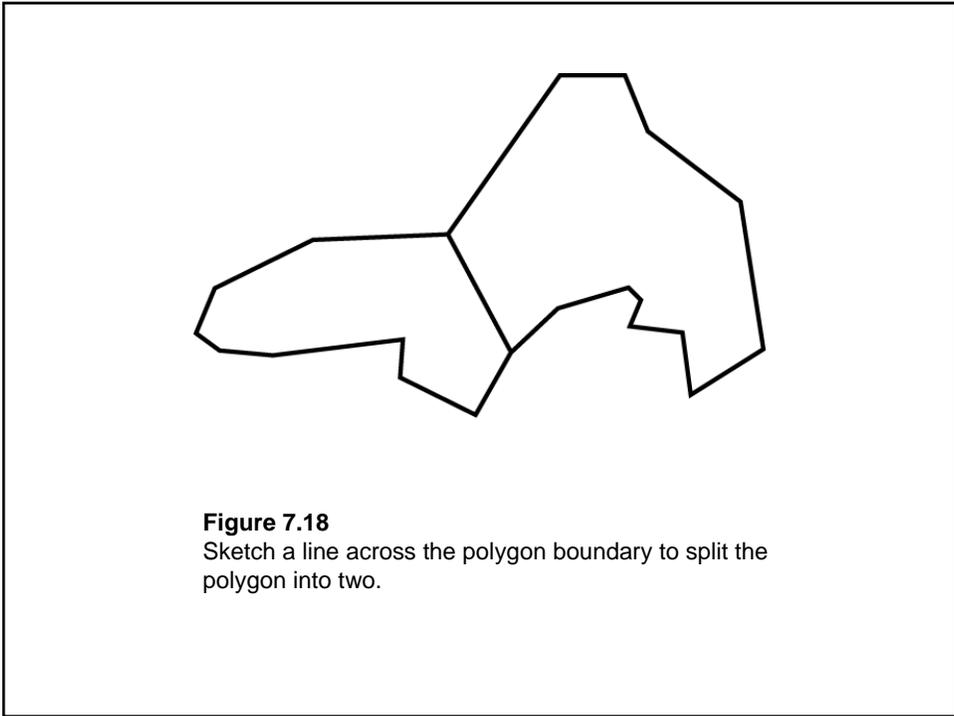

After a polygon of a shapefile is moved, a void area appears in its location.

# Nontopological Editing

Nontopological editing refers to a variety of basic editing operations that modify simple features and create new features from existing features.

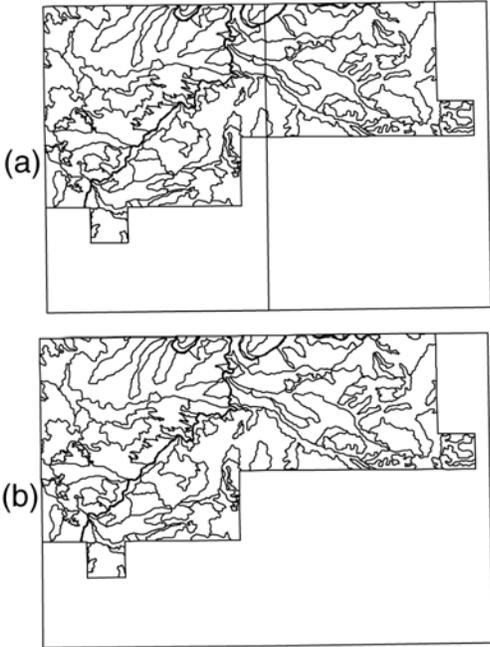

**Figure 7.17**  
Reshape a line by moving a vertex (a), deleting a vertex (b), and adding a vertex (c).

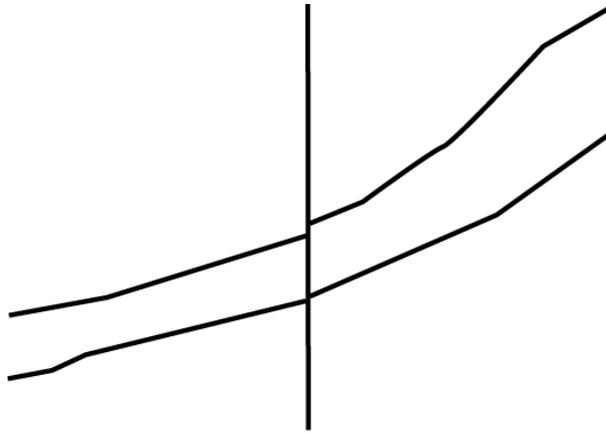

# Edgematching

Edgematching matches lines along the edge of a layer to lines of an adjacent layer so that the lines are continuous across the border between two layers.

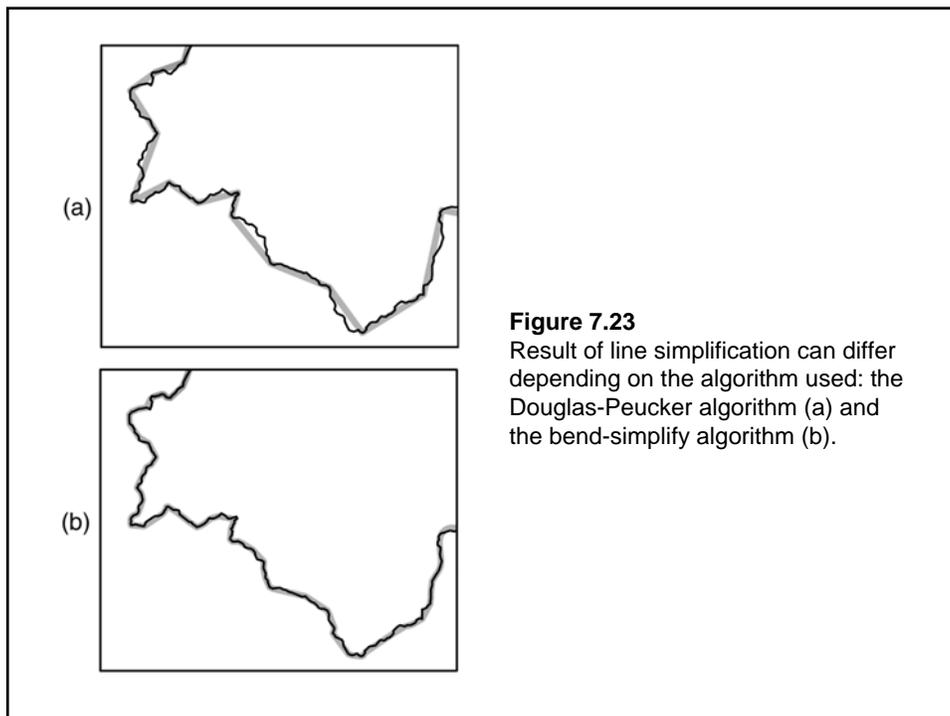

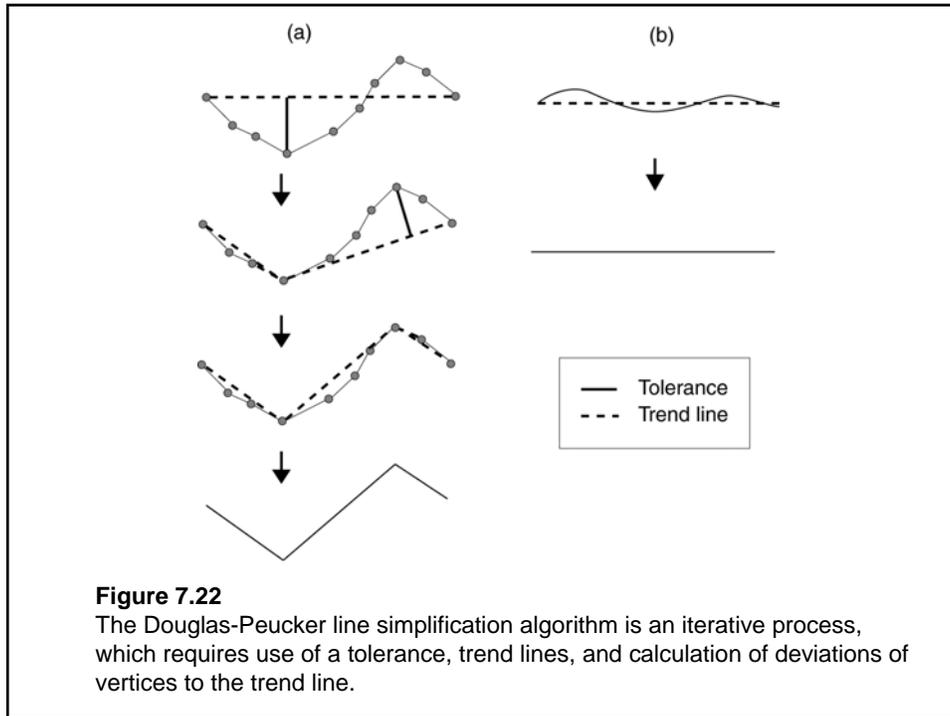

**Figure 7.20**  
Edgematching matches the lines of two adjacent layers (a) so that the lines are continuous across the border (b).

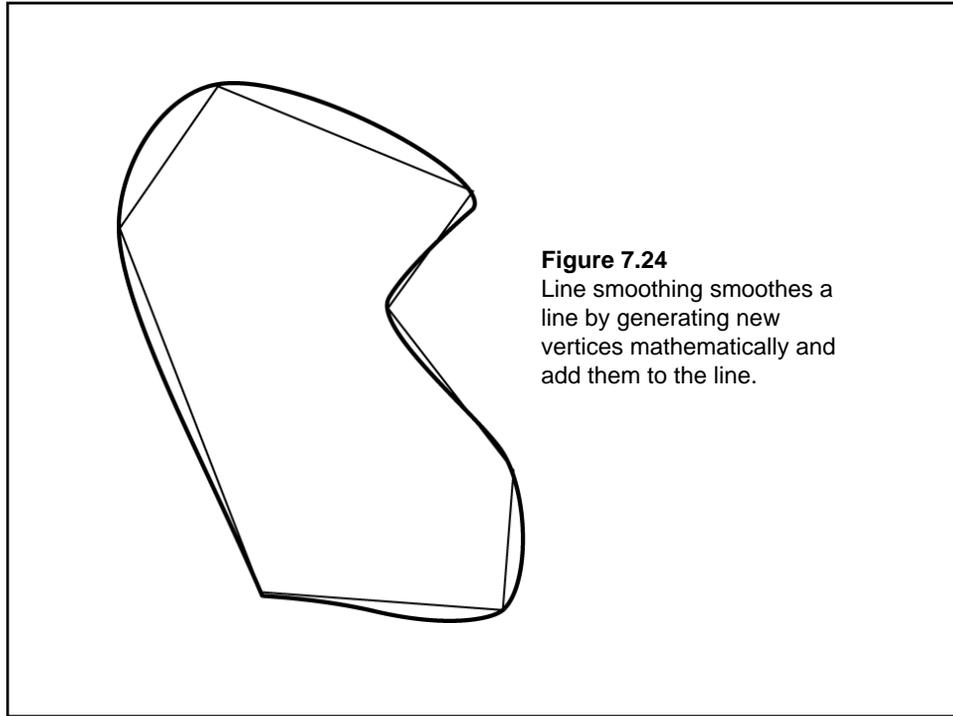

**Figure 7.21**  
Mismatches of lines from two adjacent layers are only visible after zooming in.

## Line Simplification and Smoothing

- Line simplification refers to the process of simplifying or generalizing a line by removing some of its points.
- Line smoothing refers to the process of reshaping lines by using some mathematical functions such as splines.
